

The Final exam is Tuesday (May 3) from 8 - 9:50 AM in ITT 322. It will be closed-book and notes, except for one 8.5" x 11" sheet of paper containing any notes that you want. (Plus, the Python Summary Handout) About 75% of the test will cover the following topics (and maybe more) since the second mid-term test, and the remaining 25% will be comprehensive (mostly big-oh analysis and general questions about stacks, queues, priority queues/heaps, lists, and recursion).

Chapter 18: Trees

Terminology: node, root, child, parent, siblings, leaf, interior node, edge/branch, descendant, ancestor, path, path length, depth/level, height, subtree

General and binary tree recursive definitions

Tree shapes and their heights: full binary tree, perfectly balanced binary tree, complete binary tree

Applications: parse tree, heaps, binary search trees, expression trees

Traversals: inorder, preorder, postorder, level order

Binary tree ADT: interface, processing, implementation

Binary search tree ADT: interface, implementation

AVL tree ADT: interface, implementation

Chapter 19: Sets and Dictionaries (Hashing)

Sets: applications, implementation

List implementation of sets and dictionaries; their analysis

hashing terminology: hash function, hash table, collision, load factor, chaining/closed-address/external

chaining, open-address with some rehashing strategy: linear probing, quadratic probing

hashing implementation of dictionaries and sets

File Structures - Lecture 26 handout:

http://www.cs.uni.edu/~fienu/cs052s11/lectures/lec22_questions.pdf

We talked about how the in memory data structures need to be adapted for slow disks.

From this discussion you should understand the general concepts of Magnetic disks:

- layout (surfaces, tracks/cylinders, sectors, R/W heads)
- access time components (seek time - moving the R/W heads over the correct track, rotational delay - disk spins to R/W head, data transfer time - reading/writing of sector as it spins under the R/W head)

Hash Table as a useful file structure

B+ trees as a useful file structure - see web resources:

<http://www.sci.unich.it/~acciaro/bpiutrees.pdf>

http://en.wikipedia.org/wiki/B%2B_tree

<http://www.ceng.metu.edu.tr/~karagoz/ceng302/302-B+tree-ind-hash.pdf>

Chapter 20: Graphs

Terminology: vertex/vertices, edge, path, cycle, directed graph, undirected graph

Graph implementations: adjacency matrix and adjacency list

Graph traversals/searches: Depth-First Search (DFS) and Breadth-First Search (BFS)

General Idea of the following algorithms: topological sort, Dijkstra's algorithm (single-source, shortest path), Prim's algorithm (determines the minimum-spanning tree)

You should understand the graph implementations and algorithms listed above. You should be able to trace the algorithms on a given graph.
