

The cells with LIFE are darker and filled in. You are to show what the GRID would be like in the next generation, i.e. after one single generation change. You will leave cells unchanged or mark them with E or mark them with A.

1. Mark E if a currently ALIVE cell DIES, to indicate it is EMPTY and has NO LIFE now. E for Empty. E
2. Mark A on any cell that was empty and was not alive that is ALIVE the next generation, i.e. that would be shaded in on the next generation. A for ALIVE. A
3. Leave all other cells the way they are if they do not change in the next generation. In other words, cells that were alive and are still alive do not need to be indicated or marked. Cells that were empty and are still empty do not need to be marked. Unchanged, no mark or letter needed.
