Question 3: What would you like to learn in this course?

The most common thing that we as a group wanted to get out of this course is some lessons and plans that will be implementable in our classrooms. Some of us have already started teaching computer science in our schools using code.org and we would like some resources and lessons that will engage and challenge the students who are considering a future with computer science. Lesson plans take time to develop and perfect and as a group we want some resources to jump start that process. We were also curious about some potential unplugged lessons that we could use to get the students away from the computer for the day. Another thing that we discussed may be the ability to transition between our lessons in code.org and the lessons that we create. When would it be a good time to give our outside lesson on this topic? Should we give it in the beginning, middle, or end of our unit? These are the questions that we want answered in this course.
